

It's not what you make...
It's what you keep

Strong performance is just a start

When it comes to choosing the right **Fixed Index Annuity**, performance of the underlying index is important – but is it the only factor to consider? As seen in the chart below, since 1999 the S&P 500 has outperformed 5% and 7% risk control indices¹ by at least \$150,000 on an absolute return basis.

Did you know?

A **fixed index annuity** is an insurance product that tracks an index, either a traditional index or a custom index, and provides interest credits based in part on the returns of that index.

Interest crediting strategy determines how interest changes to a fixed index annuity are measured. The interest crediting strategy chosen measures the amount of interest the annuity holder can receive over a specific time period.

Past performance is not an indicator or a guarantee of future performance. It is not possible to invest directly in an index.

Absolute returns don't tell the whole story

If the only consideration is absolute returns, the choice is easy. However, performance is not the whole story when it comes to a fixed index annuity. The **interest crediting strategy** needs to be as big a part of the decision-making-process as how the underlying index is performing. By applying a participation rate to the three indices above, it quickly becomes clear that it's not just about what you make (performance) – it's about what you keep (interest crediting strategy) that matters:

Participation rate

Percentage of the index return that is credited to the annuity holder for the strategy term.

1. Risk Control Indices are designed to shift allocations, based on signals in the market, to keep volatility at or near the stated target. When market volatility is relatively low the index will maintain its exposure riskier assets, such as equities. When volatility increases, the index is reallocated so that it is weighted toward risk-free assets, such as cash.
 2. S&P 500 Daily Risk Control 5% TR Index. The S&P 500 Risk Control™ series relies on S&P 500® methodology and overlays mathematical algorithms to maintain specific volatility targets. Index exposure is dynamically rebalanced based on observed S&P 500 historic volatility to maintain various volatility targets.
 3. S&P 500 Daily Risk Control 7% TR Index. The S&P 500 Risk Control™ series relies on S&P 500® methodology and overlays mathematical algorithms to maintain specific volatility targets. Index exposure is dynamically rebalanced based on observed S&P 500 historic volatility to maintain various volatility targets.
 4. Participation rates are hypothetical and not indicative of actual rates. Actual participation rates may vary.
 Fixed indexed annuities are insurance contracts, not registered securities or stock market investments. Fixed indexed annuities are not invested in the index itself, but rather interest is credited based on the performance of the index and the rules prescribed in the insurers index crediting strategy. Fixed indexed annuities are not issued by Franklin Templeton.

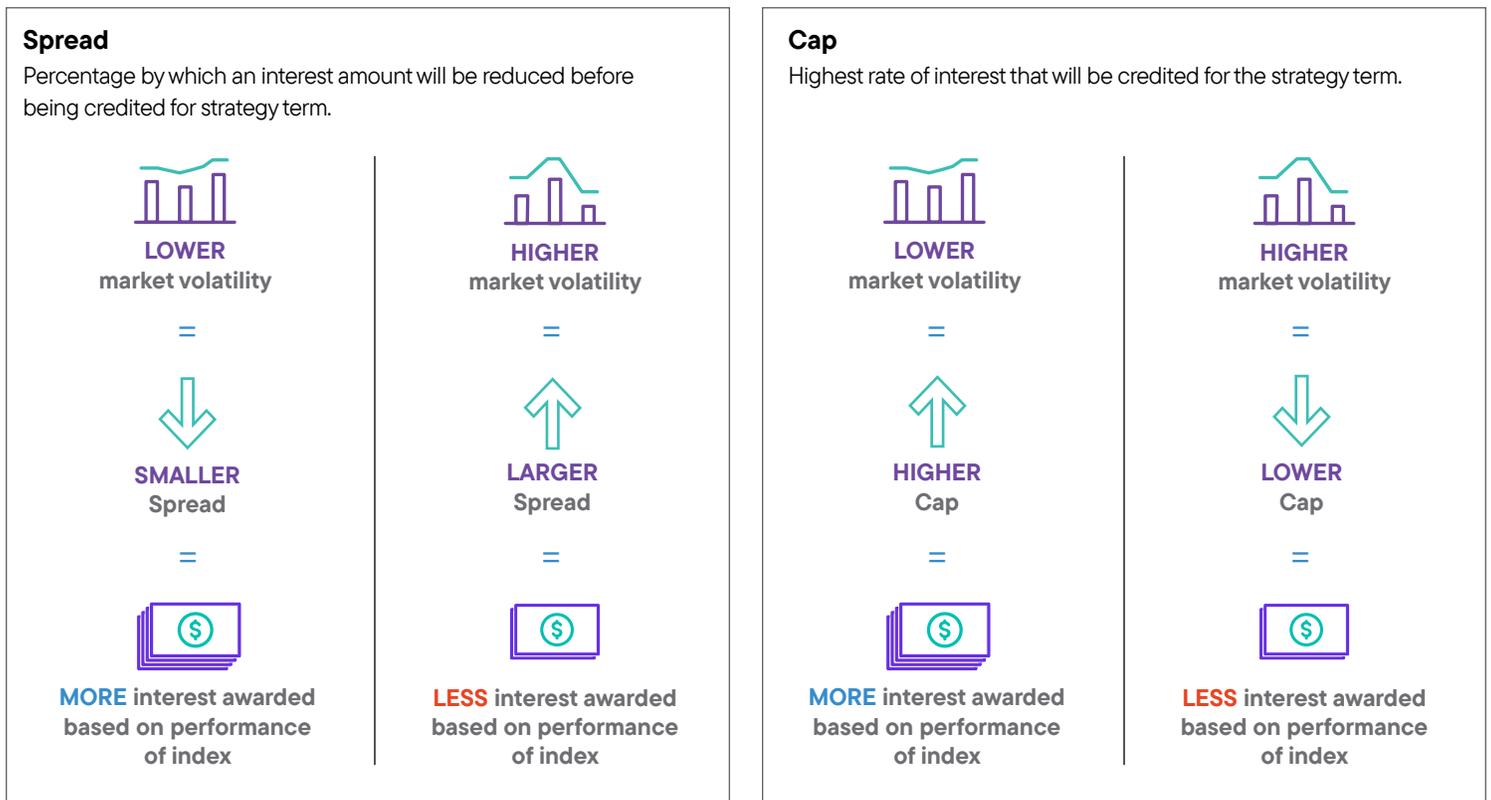

Not FDIC Insured | May Lose Value | No Bank Guarantee

Guide to what you keep

Additional interest crediting strategies

In addition to participation rates, two common interest crediting strategies for fixed index annuities are spreads and caps. Much like participation rates, spreads and caps will determine how much interest the annuity owner will receive over a specific time period.

Annuities are long-term investments designed for retirement purposes. The value of annuities is subject to market risk and will fluctuate. Product guarantees are subject to the claims-paying ability of the issuing insurance company. Earnings, when withdrawn, are subject to federal and/or state income tax, including a 10% tax penalty for withdrawals before age 59½. Some income guarantees offered with annuities take the form of optional riders and carry charges in addition to the fees and charges associated with annuity products.

There is no guarantee that any investment will achieve its objectives, generate positive returns, or avoid losses. Investments in annuity contracts may not be suitable for all investors.
